Exhaust Studs & Nuts

One of the most important, yet often overlooked areas is the exhaust. To ensure proper sealing and to make it as easy as possible to install, Diamond Engineering has designed special studs. With a bullet nose on one end helping to locate the exhaust flange so that the gasket may be compressed evenly, and make it easy to start the nuts without cross-threading. These are a must on any engine. They even had a sparkle on their own with a bullet nose ends being polished to mirror finish!

Exhaust flange nuts are also available in bulk packages.

Intake Bolts

Many of the parts in this catalog are developed from Diamond Engineering's involvement in racing. The special intake manifold bolts are direct results of these efforts. Due to the small amount of room that there is on the intake flange only a socket cap could be used. With the difficulty of aligning the intake to the cylinder heads while trying to tighten with a ball driver, again because of the limited clearance, it is not an easy task, especially in between rounds of racing. Diamond Engineering has the solution. By forming an extra small 5/16" 12 point wrenching head on a 5/16 bolt we have provided the clearance while allowing the use of the standard 5/16 box wrench. In addition to making it easier to install your intake, the 12 point head is virtually impossible to round out like a socket cap and because the bolts are part of our professional series of fasteners they're rated an impressive 170,000 PSI tensile strength. So whether you are running at the track or on the street order a set today. The time and hassle you'll save will pay for them!

Billet Office and Bar Accessories

First in a new line of billet Office and Bar Accessories from Diamond Engineering is this beautiful business card holder. CNC machined from T6-6061 billet Aluminum, polished to a mirror finish.

Many new designs and products coming soon!
